

Acton and Antelope Valley Disinfection Conversion

This project consists of converting 18 Waterworks groundwater disinfection facilities in Acton and the Antelope Valley from chlorine to chloramines disinfection. This conversion is needed to match the disinfection method that will be used by the Antelope Valley-East Kern Water Agency (AVEK) implemented in 2009. The District purchases treated surface water from AVEK and blends it with groundwater from wells to serve its customers. Both water sources must have compatible disinfection methods to avoid water quality problems. This project was completed in mid 2008.
